

LIGHT

Light is electromagnetic radiation which is visible to human's eye in way that scientists told us. Light is more than that.

It presents hope, kindness, warmth, life... Hope that presents that always can be better and that tomorrow always comes. Kindness of all people on Earth. Warmth which warms and moves us and it creates new friendships. If human feels that is lost and feels that is on the wrong way, hope will light up its cheeks and help him/her to move on the right way with the hope in the better future. Light gives us kindness which teaches us lessons about life and that we all must be kind and help each other. Warmth, feeling that light gives us, but it's hard to describe it. Warmth warms, but also it has another function. It brings us together and creates silly and funny friendships. It warms up our hearth and it takes us on unforgettable adventure. Life isn't possible without light. We can't live without light just as animals and plants. Even though we know all that, we are still polluting our world. Oil spills in the oceans, cigarettes and cars smoke, factories... All of that kind of stuff are creating global warming and it pollutes air and sky, so then we almost can't see light that gives us these gifts and feelings that are creating the better world and future.

So, dear friends and readers, we must stop the pollution and let the sun to shine because sun gives us light and we need light to become a better people and save our world.
