

ECOLOGY

When we ask some people what is ecology and why it is so important, most of them does not know anything about it. They throw rubbish wherever they can in huge amounts; even some countries hide nuclear waste in special containers and throw them in nature. People do not care about taking care for nature because they think that somebody will do that for them. In the whole world, also in Croatia in one day pass to many vehicles. Only through Šibenik pass thousands cars by day.

It is important to educate people about ecology, about exhaust gasses, cars, cigarettes, poisons that have been used in war and countries who are in war today, atomic weapons and waste. The gasses are going into the atmosphere and make ozone holes. That destroys ozone layer, which is already partly destroyed. That caused global warming. Icebergs are melting and water level is higher. Pollution has a significant impact onto climate changes. In Croatia, mostly in Dalmatia, warming temperatures are crossing the border; even weather forecast is not precise any more.

I am shocked with many different pollutions that make this world more contaminated day by day. Frequent forest fires destroy animal environment. I passed through burned forest parts. The view is terrible. Everything is black, burned, and lifeless.

People do not care about forests and animals. They care only about money. Forrest needs one year for break down one nylon bag, petroleum products need a thousand years to break down. Let' do something to educate people about harms that they are not conscious of. It is important to take care of nature because if we do not care for nature, nature will not take care for us.
